

PRACTICUM-1

Contact Tracing System for Epidemiologists and Epidemiological Research

Aman Batra

NUID: 001877232

Class: CS5200

Academic Term: Summer-2, 2020

Instructor: Dr. Martin Schedlbauer

Email : Batra.am@northeastern.edu

Individual Submission

GITHUB Repository : <https://github.com/predictbay/amancs5200>

1. Problem Definition - Contact Tracing

1.1 What is Contact Tracing?

According to WHO: Contact tracing is the process of identifying, assessing, and managing people who have been exposed to a disease to prevent onward transmission.

1.2 What is the purpose of Contact Tracing?

When systematically applied, contact tracing will break the chains of transmission of COVID-19 to prevent future waves or surges of cases, and to enable us to get back to work in a much safer way. Contact Tracing is an essential public health tool for controlling the virus.

1.3 How does Contact Tracing work?

Contact tracing for COVID-19 requires identifying people who may have been exposed to COVID-19 and following them up daily for 14 days from the last point of exposure.

The goal is to create a spider web of coronavirus transmission

Multiple Approaches To Trace Contacts:

1. An application approach, Continuous subject monitoring and data gathering is achieved using a mobile-application. Patients use the application to self-assess symptoms and report their interactions with other contacts, which can then be notified via the app, and put in incubation. For Example, a portable contact tracing application with real-time threat notifications based on GPS location/Bluetooth tracking, daily self-assessments, and contact reporting.
2. A general approach, where infected person contacts local Public Health Authorities and notifies them, PHAs then takes report of the person via calls & interviews, and prescribes test or medical assessments. Daily reports and health updates are taken by the assigned personnel until the incubation period is active. All the contract tracing is done manually by the PHAs, who then feed the data into a central reporting system.
3. A combined approach, where both self-assessments and manual assessments are possible. Patients choose if they would like to contact and schedule meetings with PHAs or prefer the use of a real-time contact tracing app regularly. PHAs gather and anonymise all the data, and put it in a graph database. The graph databases are then analysed to create heatmaps of the COVID-19 affected areas, which are later turned into containment zones.

2 Most Efficient Approach - Contact Tracing

(Combined Approach)

Combined approach assumes that the local, regional, or national Public Health body of a geographical area, has offered three ways, to keep a check on COVID-19

epidemic: a mobile application, a website, and a dedicated COVID-19 helpline to implement contact tracing measures.

1. **Automated:** A self-assessment and self-reporting based portable application, capable of running on multiple types of devices such as mobile phones, tablets, and laptops with real-time geolocation and Bluetooth based proximity tracing of other users, running the same application of their devices. Each user's *HealthStatus* tokens are broadcasted within a 30 metres radius, and every user of the application in the proximity range will receive these tokens. If a sick user is nearby, all the users in the vicinity will get a threat alert. The total interaction time or visit time of a user will be recorded whenever he or she, meets or passes by, a sick person, or visits a place. If a user is not feeling and suspects that he or she might have been exposed to COVID-19, then there is a self-assessment option which contains a predefined set of questions, that can predict the likelihood of infection. If the assessment score bypasses the defined threshold, all users in the vicinity are notified of potential threat; Local health authority(LHA) is notified via the application. The LHA then prescribes a suitable COVID-19, and if the user tests positive, an incubation period of 14 days is initiated, which contains daily self-assessments, self-quarantining, and self-reporting of every place visited, every person in touch, and every notable interaction made within the past 14 days.

2. **Semi-Automated:** Some users have privacy issues when it comes to using applications that continuously record user data, and keep surveillance over their activities. For such users, a website or a similar app without monitoring is a better option, to implement contact tracing. When such a user feels sick, he can go to the LHA website, and take a self-assessment test, if the test results indicate potential infection, their identity is anonymised and location data is fed into the central database(common to all strategies). The user has to take a daily self-assessment until he or she is marked 'healthy' again, and all the contact reporting is done on the website. The central database is used to create heatmaps of coronavirus stricken areas, the website users can manually check the heatmap zones online, whereas it is inbuilt in the application.
3. **Manual:** For users, who have no viable means to use the website or application, there is a dedicated helpline number, which takes care of daily assessments, and contact reporting. Things are done manually, via phone conversations or administered meetings, and all the gathered data is then manually uploaded to the database.

3.Database Tools Specification

Overview

The database for a Contact Tracing system is can be implemented using many relational and non-relational DBMS such MySQL, PostgreSQL, MongoDB, Neo4j, Oracle DB. Parts of the project can be implemented using graph-databases, because they will be best suited for running depth queries and discovering links at greater depths, but for this particular

Practicum, we will be using MySQL as a DBMS tool ubiquitously, and R Studio for running Analytics. MySQL has many advantages and some limitations, as given below:

Advantages of MySQL

1. Open source, inexpensive and readily available.
2. Industry Standard, and very popular.
3. Extensive support available online.
4. Ease, Intuitiveness and Usability
5. Outstanding InnoDB engine.

Drawbacks

1. Scalability issues can arise with time.
2. Not very easy to debug.
3. Does not support very large databases efficiently.

Advantages of R

1. Open source, Platform Independent
2. Rapid, and quality plotting
3. Non-Coder friendly, anyone can start plotting within a hours
4. Rich and continuously growing sets of packages (>10000) in the CRAN repository

Drawbacks

1. R Utilizes more memory as objects are stored in the memory.
2. Slower than other programming languages like Python and Matlab
3. Does not support very large scale applications efficiently.

4. Overall Assumptions & Constraints.

Assumptions:

1. Only some parts of the whole application will be reflected in the relational database, some data will stored locally on the host devices, such as state variables, local variables, events data, device permissions details, etc.
2. There can be many use cases, but the database is designed keeping in mind only some of these use cases, hence some parts of the database can be missing For Example. The assessment-survey module can have 4 more classes, but we are only using one for now.

3. The depth of queries will be set to 5, because MySQL is not a graph-database, it takes a good amount of time and processing power to create Joins, and make connections.
4. Application logic and host application will be created at a later time.

Constraints:

- **Domain Level:**

1. **Varchar** for string data

2. **Integer** for whole numbers

3. **Boolean** for binary choices (True or False, Yes or No, Correct or Incorrect, these kind of choices will be implemented using 0s & 1s

4. **Enum** for Lists or categorical attributes

5. **Text** for descriptions

- **Referential Integrity:**

1. *Place* extends to *Interactions*, *AppUser*, *Visits*, *PublicHealthAuthority*

2. *Person* extends to *AppUser* and *PublicHealthWorker*

3. *AppUser* extends to *Place*, *Interactions*, *Assessment*, *HealthReportCheck* and *Person*

4. *UserEvents* extends to *Visits*, *Interactions* and *ContactHistoryLog*

5. *PersonNotification*, *AppUserEmail*, *PersonPhone* are linking tables.

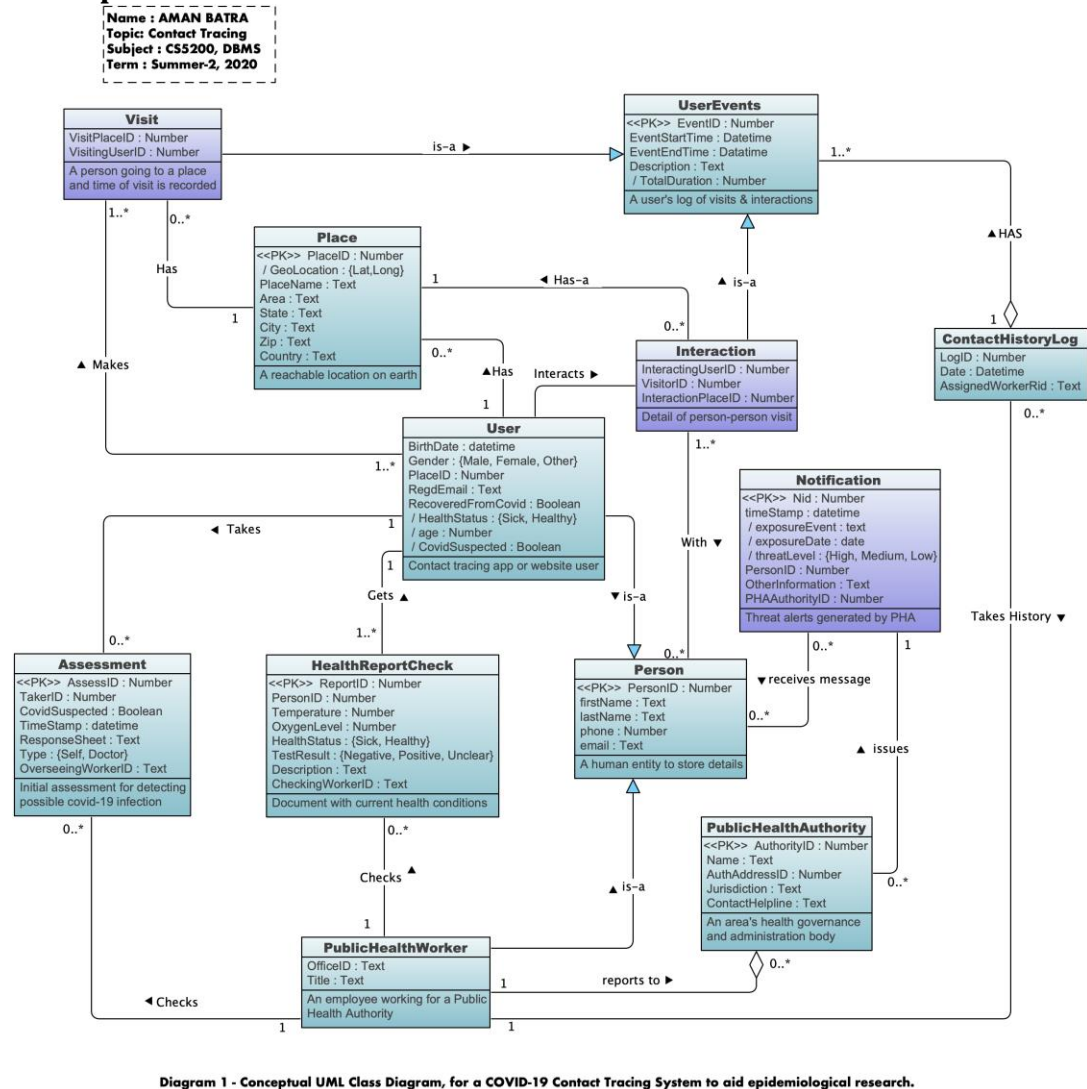

- **Entity Integrity**

1. All classes have primary keys, all primary keys are set to NOT NULL

2. Key constraints are enabled SET FOREIGN_KEY_CHECKS = 1

5.UML Class Diagram

Conceptual Model Link

Design Tool Used: Visual Paradigm Community Edition for Mac

6. Entity Relationship Diagram

Link to LucidChart: "Logical Model LUCIDCHART Link"

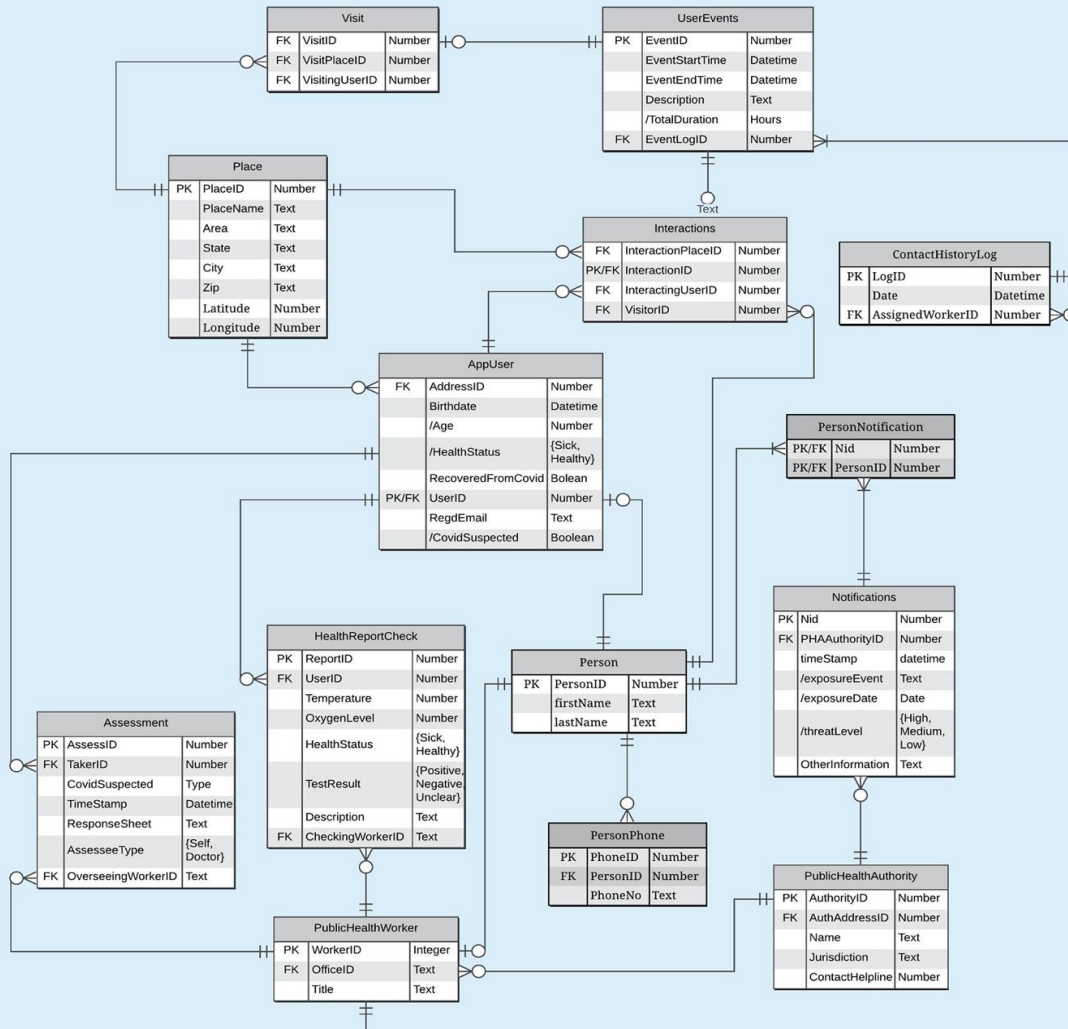

Diagram 2 - Logical ER Diagram, for a COVID-19 Contact Tracing System to aid epidemiological research.

7. Schema Generation & Normalization Check Results

Relational Schema:

Place(*placeint* ,placename,streetarea,city,state,zip,latitude,longitude)

Person(*PersonID*,firstName,lastName)

PersonPhone(*PhoneNo*,PersonID)

AppUser(*UserID*,*AddressID*,RecoveredFromCovid)

AppUserEmail(*EmailID*, *UserID*)

PublicHealthWorker(*WorkerID*,*title*,*officeID* ,*PublicAuthID*)

PublicHealthAuthority(*AuthorityID* ,*AuthAddressID*,*Name*,*Jurisdiction*)

PublicHealthAuthorityHelpline(*HelplineNo*,*AuthorityID*)

UserEvent(*EventID*,*EventStartTime*,*EventEndTime*,*Description*)

Visits(*VisitID*,*VisitingUserID*,*VisitPlaceID*)

Interactions(*InteractionID* ,*interactingUserID*,*VisitorID*,*InteractionPlaceID*)

Notifications(*Nid* ,*PHAAuthorityID*,*timestamp*,*OtherInformation*)

HealthReportCheck(*ReportID*
,*UserID*,*Temperature*,*OxygenLevel*,*HealthStatus*,*TestResult*,*Descriptions*,*CheckingWorkerID*, *ReportDate*)

Assessment(*AssessID*,*TakerID*,*CovidSuspected*,*TimeStamp*,*ResponseSheet*, *AssesseeType*,
OverseeingWorkerID)

PersonNotification(*Nid*, *PersonID*)

Normalization to BCNF

This following table lists out every relation in the database and provides proof to make sure its in BCNF. There Is no need to prove lower normal forms like 1NF, 2NF and 3NF because, if a relationship in BCNF, it IMPLIES that it is already normalized in lower forms.

The relationships shows below, comply with all of the following criterion, needed for validating BCNF.

1. Every relationship has a valid candidate key as their determinants(All determinants are candidate keys)
2. There is no partial dependency of any kind
3. No composite candidate keys with overlapping attributes
4. No multivalued attributes exist
5. No transitive dependency.

✗	No Partial Dependency	✓	2NF The table is in 2NF
✗	No Transitive Dependency	✓	3NF The table is in 3NF
✗	No Prime to Non-Prime Dependency	✓	BCNF The table is in BCNF

1

“AppUser”

personid	→	addressid
addressid	→	personid name birthdate

UserID=>addressid UserID=>=>name UserID=>birthdate

- **UserID** is a candidate key and Primary key which uniquely identifies Birthdate, AddressID, RecoveredFromCovid.
- **AddressID** is a Candidate Key, because it can uniquely identify an AppUser
- No Partial Dependency or Multivalued Attribute exist in this relationship
- There is no non-trivial FD without a candidate key. Hence table is in BCNF

2

“AppUserEmail”

EmailID -> UserId

- **UserID** is a candidate key and Primary key which uniquely identifies Birthdate, AddressID, RecoveredFromCovid.
- **AddressID** is a Candidate Key, because it can uniquely identify an AppUser
- No Partial Dependency or Multivalued Attribute exist in this relationship
- There is no non-trivial FD without a candidate key. Hence table is in BCNF

3

"Person"

PersonID=>firstname PersonID=>lastname

- **PersonID** is a candidate key and Primary key which uniquely identifies firstname, lastname
- No Partial Dependency or Multivalued Attribute exist in this relationship
- There is no non-trivial FD without a candidate key. Hence table is in BCNF

4

"PersonPhone"

PhoneNo=>PhoneID - **PhoneNo** is a candidate key and Primary key which uniquely identifies PersonID - PersonID is not unique here because a user can have multiple phone numbers. - No Partial Dependency or Multivalued Attribute exist in this relationship - There is no non-trivial FD without a candidate key. Hence table is in BCNF

5

AuthorityID=>AuthAddressID AuthorityID=>Name

AuthorityID=>Jurisdiction

- **authorityid** is a candidate key and Primary key which uniquely identifies all other attributes
- name, jurisdiction for a secondary relationship that can identify authorityid
- No Partial Dependency or Multivalued Attribute exist in this relationship
- There is no non-trivial FD without a candidate key. Hence table is in BCNF

6

helplineneno → authorityid

helplineneno=>authoritid - **helplineneno** is a candidate key and Primary key which uniquely identifies AuthorityID, because a number cannot be shared by multiple authorities in our assumption - authorityID has multiple numbers hence not unique to relationship - No Partial Dependency or Multivalued Attribute exist in this relationship - There is no non-trivial FD without a candidate key. Hence table is in BCNF

7

workerid → officeid

officeid → title publicauthid workerid

Workerid => officeid Workerid => Title Workerid => publicauthid - **WorkerID** is a candidate key and Primary key which uniquely identifies Title, OfficeID, publicauthID - **OfficeID** is a candidate key which uniquely identified the PK - PubliAuthID has multiple workers so not unique to relationship - No Partial Dependency or Multivalued Attribute exist in this relationship - There is no non-trivial FD without a candidate key. Hence table is in BCNF

8

Assessment	
AssessID INT	
TakerID INT	
CovidSuspected TINYINT(1)	
TimeStamp DATETIME	
ResponseSheet VARCHAR(255)	
AssesseeType ENUM(...)	
OverseeingWorkerID INT	
Indexes	

assessid	→	takerid	covidsuspected	timestamp	responsesheet	assesseetype	overseeingworkerid
timestamp	takerid	overseeingworkerid	→	assessid			

AssessID=>takerid AssessID=>covidsuspected

AssessID=>timestamp AssessID=>responsesheet AssessID=>assesseetype

AssessID=>overseeingworkerid - **WorkerID** is a candidate key and Primary key which uniquely identifies all the attributes - Same TakerID is on multiple assessments so not unique to relationship - Timestamp, takerid and overseeingworkerid form a secondary relationship (non-primes to key) - No Partial Dependency or Multivalued Attribute exist in this relationship - There is no non-trivial FD without a candidate key. Hence table is in BCNF

9

HealthReportCheck	
ReportID INT	
UserID INT	
Temperature DECIMAL(3,3)	
OxygenLevel DECIMAL(3,3)	
HealthStatus ENUM(...)	
TestResult ENUM(...)	
Description TEXT	
CheckingWorkerID INT	
Indexes	

reportid	→	userid	temperature	oxygenlevel	healthstatus	testresult	description	checkingworkerid	reportdate
----------	---	--------	-------------	-------------	--------------	------------	-------------	------------------	------------

ReportID=>userid ReportID=>temperature

ReportID=>oxygenlevel ReportID=>healthstatus ReportID=>testresult

ReportID=>description ReportID=>checkingworkerid ReportID=>reportdate

- **ReportID** is a candidate key and Primary key which uniquely identifies all the attributes
- Same UserID is on multiple Reports so not unique to relationship
- No Partial Dependency or Multivalued Attribute exist in this relationship
- There is no non-trivial FD without a candidate key. Hence table is in BCNF

10

Interactions	
InteractionID	INT
InteractingUserID	INT
VisitorID	INT
InteractionPlaceID	INT
Indexes	

interactionid → interactinuserid interactionplaceid visitid

InteractionID=>interactinguserid

InteractionID=>interactingplaceid InteractionID=>visitid

- **InteractionID** is a candidate key and Primary key which uniquely identifies all the attributes
- Same InteractingUseID, VisitorID and InteractionPlaceID can exist on multiple interactions so not unique to relationship
- No Partial Dependency or Multivalued Attribute exist in this relationship
- There is no non-trivial FD without a candidate key. Hence table is in BCNF

11

UserEvents	
EventID	INT
EventStartTime	DATETIME
EventEndTime	DATETIME
LogBookID	INT
Description	VARCHAR(1200)
Indexes	

eventid → logbookid description starttime endtime

eventid=>logbookid eventid=>description

eventid=>eventstarttime eventid=>eventendtime - **EventID** is a candidate key and Primary key which uniquely identifies logbookid, description, eventstarttime, eventendtime - Same set of start time, end time and logbookid can exist in case the database is really large so they are not unique to relationship - No Partial Dependency or Multivalued Attribute exist in this relationship - There is no non-trivial FD without a candidate key. Hence table is in BCNF

12

Place	
placeid	INT
placename	VARCHAR(255)
streetarea	VARCHAR(255)
state	VARCHAR(255)
city	VARCHAR(255)
zip	VARCHAR(255)
latitude	DECIMAL(10,8)
longitude	DECIMAL(11,8)
Indexes	

placeid → placename streetarea state city country latitude longitude

placeid=>placename placeid=>streetarea

placeid=>state placeid=>city placeid=>coountry placeid=>latitude placeid=>longitude -

placeid is a candidate key and Primary key which uniquely identifies logbookid, description, eventstarttime, eventendtime - Same set of address and coordinates can exist in case for multiple persons sharing an address, so they are not unique to relationship - No Partial Dependency or Multivalued Attribute exist in this relationship - There is no non-trivial FD without a candidate key. Hence table is in BCNF

13

Nid, PersonID - (Nid, PersonID) is the only candidate key and a primary key, no non-prime attribute exist, so no dependency - No Partial Dependency or Multivalued Attribute exist in this relationship - There is no non-trivial FD without a candidate key. Hence table is in BCNF

14

nid => PHAAuthorityid, timestamp, otherinformation
 PHAAuthorityid, timestamp, otherinformation => nid
 nid => PHAAuthorityid, timestamp, otherinformation - **nid** is a candidate key and Primary key which uniquely identifies PHAAuthorityID, timestamp, otherinformation - trivial attributes (phaauthorityid, timestamp, otherinformation) form a secondary relationship. (Non-prime to key) - No Partial Dependency or Multivalued Attribute exist in this relationship - There is no non-trivial FD without a candidate key. Hence table is in BCNF

15

logid => date, assignedworkerid - **logid** is a candidate key and Primary key which uniquely identifies date and assignedworker - AssignedWorkerID can exist on multiple logs, so it is not unique to this relationship - No

Partial Dependency or Multivalued Attribute exist in this relationship - There is no non-trivial FD without a candidate key. Hence table is in BCNF

16

visitid → **visitplaceid** **visitinguserid** visitid=>visitinguserid visitid=>visitplaceid - **VisitID** is a candidate key and Primary key which uniquely identifies VisitPlaceID and VisitingUserID - (VisitPlaceID,VisitingUserId) do not uniquely identify a visit because, there can be multiple visits, even on the same day - No Partial Dependency or Multivalued Attribute exist in this relationship - There is no non-trivial FD without a candidate key. Hence table is in BCNF

8. Integrity Checking Trials & Proofs

1.)Referential Integrity : Foreign Key Check

Test #1

Attempt to deleted a referenced record:

```
DELETE from AppUser where userid = 1499;
```

Text Box: *DELETE from AppUser where userid = 1499;*

Response:

```
Error Code: 1451. Cannot delete or update a parent row: a foreign key constraint fails ('contacttracingdb`.`appuseremail', CONSTRAINT 'appuseremail_ibfk_1' FOREIGN KEY ('UserID') REFERENCES 'appuser' ('UserID')) 0.0039 sec
```

Text Box: *Error Code: 1451. Cannot delete or update a parent row: a foreign key constraint fails (contacttracingdb.appuseremail, CONSTRAINT appuseremail_ibfk_1 FOREIGN KEY (UserID) REFERENCES appuser (UserID)) 0.0039 sec*

Test#2

Attempt to insert an unreferenced record:

```
INSERT INTO PublicHealthWorker
VALUES (1600, 'MisterA', 131245, 13112);
```

Text Box: *INSERT INTO PublicHealthWorker VALUES(1600,'MisterA',131245,13112);*

Response:

```
Error Code: 1452. Cannot add or update a child row: a foreign key constraint fails
('contacttracingdb`.`publichealthworker`, CONSTRAINT
`publichealthworker_ibfk_2` FOREIGN KEY (`WorkerID`) REFERENCES
`person` (`PersonID`))
```

Text Box: *Error Code: 1452. Cannot add or update a child row: a foreign key constraint fails (contacttracingdb.publichealthworker, CONSTRAINT publichealthworker_ibfk_2 FOREIGN KEY (WorkerID) REFERENCES person (PersonID))*

2.) Domain Integrity : Alien Value Check***

Test #1

Attempt to insert a non-allowed value:

```
INSERT INTO Assessment VALUES(3899,1600,0,'2020-05-29 08:37:55','a
random description','Friend',1511)
```

Text Box: *INSERT INTO Assessment VALUES(3899,1600,0,'2020-05-29 08:37:55','a random description','Friend',1511)*

Response:

```
Error Code: 1265. Data truncated for column 'AssesseeType' at row 1
0.00028 sec
```

Text Box: *Error Code: 1265. Data truncated for column 'AssesseeType' at row 1 0.00028 sec*

*** Test#2

Attempt to INSERT a value outside bounds:

```
INSERT INTO Place VALUES(1002, 'Parua', 'RODQ
PLACE', 'EAST BOSTON', 'MA', '2128', 42.36443246, -
731234568910);
```

Text Box: *INSERT INTO Place VALUES(1002,'Parua','RODQ PLACE','EAST BOSTON','MA','2128',42.36443246,-731234568910);*

Response:

```
Error Code: 1264. Out of range value for column 'longitude' at row 1  
0.00026 sec
```

Text Box: Error Code: 1264. Out of range value for column 'longitude' at row 1 0.00026 sec

3.) Entity Integrity and Key Constraints : Primary Key Null check

Test #1

Attempt to INSERT a NULL value for PRIMARY KEY :

```
INSERT INTO AppUserEmail(UserID, EmailID) VALUES (1101,null);
```

Text Box: INSERT INTO AppUserEmail(UserID, EmailID) VALUES (1101,null);

Response:

```
Error Code: 1048. Column 'EmailID' cannot be null
```

Text Box: Error Code: 1048. Column 'EmailID' cannot be null

Test#2

Attempt to INSERT a VALUE in AUTO_INCREMENT Primary key field: We can clearly see that the Primary Key was autogenerated when a NULL value was passed.

```
INSERT INTO Place VALUES (NULL, 'Aman', 'Batra  
PLACE', 'SOUTH BOSTON', 'MA', '2128', 42.36467840, -  
72.03322720);  
Select * FROM PLACE where placename='Aman';
```

*Text Box: INSERT INTO Place VALUES(NULL, 'Aman', 'Batra PLACE', 'SOUTH BOSTON', 'MA', '2128', 42.36467840, -72.03322720); Select * FROM PLACE where placename='Aman';*

Response:

```
1 row(s) affected.  
  
1001 Aman Batra PLACE SOUTH BOSTON MA 2128  
42.36467840 -72.03322720
```

Text Box: 1 row(s) affected. 1001 Aman Batra PLACE SOUTH BOSTON MA 2128 42.36467840 -72.03322720

Test#3: Checking Uniqueness of Keys

Counting primary keys of Places

```
SELECT placeid, COUNT(*) as total FROM place GROUP BY  
placeid HAVING total > 1;
```

Text Box: SELECT placeid, COUNT() as total FROM place GROUP BY placeid HAVING total > 1;*

Response:

```
0 row(s) returned
```

Text Box: 0 row(s) returned

9 . Create Tables and Insert Values

library(RMySQL)

Warning: package 'RMySQL' was built under R version 4.0.2

Loading required package: DBI

```
library(DBI)
library(RColorBrewer)
conn = dbConnect(MySQL(), userName="root", password="atcbtra123",
dbname="ContactTracingDB", host="localhost",port = 3306)
```

```
dbSendQuery(conn,'CREATE TABLE IF NOT EXISTS Place (
  placeid INT NOT NULL AUTO_INCREMENT,
  placename VARCHAR(255) NOT NULL,
  streetarea VARCHAR(255) NOT NULL,
  state VARCHAR(255) NOT NULL,
  city VARCHAR(255) NOT NULL,
  zip VARCHAR(255) NOT NULL,
  latitude decimal(10,8) signed NOT NULL,
  longitude decimal(11,8) signed NOT NULL,
  PRIMARY KEY (placeid)
);')
```

```
## <MySQLResult:-813415656,0,0>
```

```
dbSendQuery(conn,'CREATE TABLE IF NOT EXISTS Person (
  PersonID INT NOT NULL AUTO_INCREMENT,
  firstName VARCHAR(255) NOT NULL,
  lastName VARCHAR(255),
  PRIMARY KEY (PersonID)
);')
```

```
## <MySQLResult:-795721656,0,1>
```

```
dbSendQuery(conn,'CREATE TABLE IF NOT EXISTS AppUser (
  UserID INT NOT NULL,
  Birthdate date NOT NULL,
  AddressID INT NOT NULL,
  RecoveredFromCovid Boolean,
  PRIMARY KEY (UserID),
  FOREIGN KEY(UserID) REFERENCES Person(PersonID),
  FOREIGN KEY (AddressID) REFERENCES Place(PlaceID)
);')
```

```
## <MySQLResult:2,0,2>
```

```
dbSendQuery(conn,'CREATE TABLE IF NOT EXISTS PublicHealthAuthority (
  AuthorityID INT NOT NULL AUTO_INCREMENT,
  AuthAddressID INT NOT NULL,
  Name VARCHAR(255) NOT NULL,
  Jurisdiction VARCHAR(255),
  PRIMARY KEY (AuthorityID),
  FOREIGN KEY (AuthAddressID) REFERENCES Place(PlaceId)
);')
```

```
## <MySQLResult:-2,0,3>
```

```
dbSendQuery(conn, 'CREATE TABLE IF NOT EXISTS PublicHealthWorker (  
  WorkerID INT NOT NULL,  
  Title VARCHAR(255) NOT NULL,  
  OfficeID VARCHAR(255) NOT NULL,  
  PublicAuthID INT NOT NULL,  
  PRIMARY KEY (WorkerID),

10. Query Generation, Scripts & Outputs

QUERY - 1 - A SIMPLE JOIN QUERY

Joining Tables: AppUser, Person, AppUserEmail

Goal : To find all the details of a user who tested positive in COVID-19 Drug Test

SQL: SELECT * FROM AppUser INNER JOIN Person ON AppUser.UserID=Person.PersonID
 INNER JOIN AppUserEmail on AppUser.UserID=AppUserEmail.UserID INNER JOIN Place on
 AppUser.AddressID=Place.placeid INNER JOIN HealthReportCheck on
 AppUser.UserId=HealthReportCheck.UserID WHERE
 HealthReportCheck.TestResult='positive';

Response: 153 row(s) returned

RESULT SCREENSHOTS:

****QUERY *2**** - A Subquery to count total number of possible cases of direct person to person transmission in Massachusetts state.

SQL: SELECT count(*) as "Total probable cases of Direct Transmission via person to person interactions in Massachusetts" FROM (SELECT i.InteractingUserID FROM Interactions i

INNER JOIN UserEvents on i.InteractionID=UserEvents.EventID INNER JOIN HealthReportCheck r1 on i.InteractingUserID=r1.UserID INNER JOIN HealthReportCheck r2 on i.VisitorID=r2.UserID INNER JOIN Place on i.InteractionPlaceID=place.placeid WHERE r1.TestResult='POSITIVE' and r2.TestResult in ('NEGATIVE','UNCLEAR') AND r1.ReportDate<r2.ReportDate AND Place.State in ('MA')) as derived;

1 row(s) returned

RESULT SCREENSHOTS:

Total probable cases of Direct Transmission via person to person interactions in Massachusetts
58

R-Notebook Execution

```
val2 <- dbFetch(dbSendQuery(conn,"SELECT count(*) as
TotalProbableCasesViaPersonToPersonMassachusetts
FROM
(SELECT i.InteractingUserID FROM Interactions i
INNER JOIN UserEvents on i.InteractionID=UserEvents.EventID
INNER JOIN HealthReportCheck r1 on i.InteractingUserID=r1.UserID
INNER JOIN HealthReportCheck r2 on i.VisitorID=r2.UserID
INNER JOIN Place on i.InteractionPlaceID=place.placeid
WHERE r1.TestResult='POSITIVE' and r2.TestResult in ('NEGATIVE','UNCLEAR')
AND r1.ReportDate<r2.ReportDate
AND Place.State in ('MA')
) as derived;" ))

val2

## TotalProbableCasesViaPersonToPersonMassachusetts
## 1 58
```

QUERY 3 - A QUERY with a HAVING CLAUSE to return the details of visits made by people who tested positive, within 20 days(before and after) of getting the test reports. Where the visit lasted longer than 4 hours.

SQL:

```
SELECT a.UserID, p.firstName, s.PhoneNo, u.EventStartTime as "Time of
Visit",TIMEDIFF(u.EventEndTime,u.EventStartTime)as DurationOfVisit,
m.placename,m.streetarea, m.city, m.longitude, m.latitude FROM visit v INNER JOIN
AppUser a on v.VisitingUserID=a.UserID INNER JOIN Person p on a.userid=p.PersonID
```

```
INNER JOIN PersonPhone s on p.PersonID=s.PersonID INNER JOIN Place m on
v.VisitPlaceID=m.placeid INNER JOIN UserEvents u on v.VisitID=u.EventID INNER JOIN
HealthReportCheck h on a.UserID=h.UserID WHERE h.TestResult='POSITIVE' AND
datediff(h.ReportDate, u.EventStartTime)<20 AND datediff(h.ReportDate,
u.EventStartTime)>-20 HAVING DurationOfVisit>'04:00:00' ORDER by DurationOfVisit
```

9 row(s) returned

RESULT SCREENSHOTS:

QUERY 4 - A COMPLEX QUERY - A depth-2 search query to find out all interactions of persons, who came out positive/unclear in the covid-19 test, after their interacting with some person in the past.

Example Case:

- John Doe meets Sabrina Chan, and Jian Yang.
- John Doe was found positive, so Sabrina Chan and Jian Yang take covid tests.
- Jian tests positive, while Sabrina tests negative, so we need to trace Jian's interactions now.

SQL: select o.FirstName as "Guy1 who found out he got exposed", p.FirstName as "Guy2 who had met guy1", s.PhoneNo as "Phone number of Guy2", u.eventstarttime as "Interaction Start Details", u.eventendtime as "Interaction End Details" from interactions a, person p, personphone s, userevents u, person o WHERE a.InteractionID=u.eventid AND p.personid = a.visitorid AND s.PersonID=p.PersonId AND a.Interactinguserid=o.personid

Results

Note: We don't use the distinct keyword because we want to find out all interactions, even if there were more than one!

We can go till depth 5 with MySQL in a medium sized database, after depth-5 mysqld crashes within 30 minutes of wait.
